So for the top grid, this is referring to the NSA's Actions of secretly gather Us citizen and foreigners Data. This violates privacy, security, confidentiality, and safety in society, telecommunication and GPS. One of the ways the NSA got the data was from metadata, this metadata was unique phone number/email address of caller/recipient, the time of calls and their duration, and the location of caller/recipient.			
The act of the NSA gathering metadata was actually ruled unconstitutional later on, as it exposed citizens activities, life, communications, etc and possess a threat to their privacy, confidentiality, safety, and security.			
With the location also being exposed in the metadata, this also impacts the GPS.			
The bottom grid looks at this from the POV of Edward Snowden. He obviously violated the privacy, security, confidentiality and safety of the global surveillance, national security, and society to a smaller degree.			
One, he illegally put out confidential information from the NSA. This arguably puts the NSA in a vulnerable and weak positions, which in a smaller degree, impacts the safety and security of society.
